

## Unilode Aviation Solutions go green with electric trucks from Briggs

### SITUATION

Unilode Aviation Solutions are one of the leading service suppliers to the aviation industry. As part of a project across multiple sites, they required an overhaul of their existing materials handling fleet to help lower maintenance and operational costs without compromising on performance.

### SOLUTION

The new Hyster electric forklifts replace a previous fleet of gas machines and will ensure Unilode's operators can work more safely and with greater precision. By choosing to invest in electrification, Unilode are taking tangible action to reduce their carbon footprint and deliver on sustainability targets.

As the UK's premier asset management and engineering services specialist, Briggs was able to support Unilode through every step of the process to fully understand their requirements and supply an equipment solution that is tailored precisely to meet their demands.

### RESULT

Unilode are planning to roll-out a switch to electric materials equipment across their MRO network. Analysis of this new fleet's performance at the Heathrow site, will help provide valuable insight and information ahead of this wider implementation.

### At A Glance

- **Reduction in carbon emissions compared to previous gas machines**
- **Greater accuracy and comfort for operators**
- **Lower operational and maintenance costs**

"The new electric trucks supplied by Briggs Equipment are a fantastic addition to our industrial equipment fleet. The new equipment is cleaner, greener and more efficient, helping our operators complete their work with greater precision.

These are more productive forklifts with zero emissions that will help us to continue reducing our carbon footprint. Over the coming year more stations in our MRO network will be making this change to further enhance the sustainability of Unilode's ULD solutions."
